

Hub API

Introduction

Springboard Delivery Hub API allows you to link Springboard Delivery with other systems, to both send data to the Hub and extract them from the Hub. We have [packaged integrations](#) or you can create your own, based on the Springboard Delivery web API.

For developer-level API reference, see [Springboard Delivery API](#). This lets you review and try out available functions. We recommend you establish a separate test organisation to avoid the possibility of making unwanted changes to your production data. Once you have tested your integration in a test organisation, you can switch to credentials for your production organisation to start using your integration in production.

Logging In and Authentication

To establish an API session, start by making a POST request to `https://hub.springboardapplications.com/api/Data/login`. A request with valid credentials will return an authentication token. The token needs to be sent in the `X-SessionKey` HTTP header with subsequent requests to any of the other API functions.
